

## Here's how it works!

An accident happens quickly, the patient is unresponsive, the emergency doctor is called.

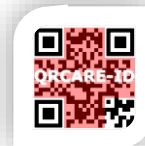

The emergency doctor is on the way. In most cases, they arrive at the scene of the accident and have very little information about the patient.

Now every minute counts, the emergency doctor is treating a partly unknown patient. What would help here would be quick access to the patient's health data in order to have all the important information.

The emergency doctor can use the QRCare-ID to access the patient's emergency data and thus ensure that they receive the right medication.

The QRCare-ID sticker can be attached to the motorbike, helmet or jacket.

The emergency data is entered into the system in co-operation with your family doctor. This is the only way to ensure that the emergency doctor has access to the correct data
